

## Ultra-Low Power Wi-Fi + Bluetooth® LE Combo Module

### General Description

The DA16600 series is a highly integrated ultra-low-power Wi-Fi + Bluetooth® Low Energy Combo Module solution. This module includes the DA16200 that has an 802.11b/g/n radio (PHY), a baseband processor, a media access controller (MAC), on-chip memory, and a host networking application processor. DA16600 also has a DA14531 that has a 2.4 GHz transceiver and an Arm® Cortex-M0+® microcontroller with a RAM of 48 kB and a One-Time Programmable (OTP) memory of 32 kB. The radio transceiver, the baseband processor, and the qualified Bluetooth® low energy stack are fully compliant with the Bluetooth Low Energy 5.1 standard.

The DA16600 is a synthesis of breakthrough ultra-low-power technologies, which enables an extremely low power operation in the module. The DA16200 and DA14531 shut down every micro element of the chip that is not in use, which creates a power consumption that is near zero when not actively transmitting or receiving data. Such low power operation can extend the battery life up to a year or more depending on the application. The DA16600 also enables ultra-low power transmission and reception modes when the SoC needs to be awake to exchange information with other devices. Advanced algorithms enable sleep mode until the exact moment when wake up is required to transmit or receive data.

## Ultra-Low Power Wi-Fi + Bluetooth® LE Combo Module

#Pin	Pin Name	Type	Drive (mA)	Reset State	Related Device	Description
51	VBAT_BLE	VDD	-	-	DA14531	Supply power for DA14531

**Note 1** Pin3, Pin8, Pin 38, Pin 39, Pin 43, and Pin 44 are connected internally so these pins cannot be used as GPIO or as wake up input in application system.

**Note 2** P0\_0 has a reset function, but it is shared with GTL. It is recommended to connect the remaining GPIO as an additional reset function when P0\_0 is not available for reset in abnormal situations.

Within the DA16600 module, 4 pins of the DA16200 and the DA14531 are internally connected and therefore cannot be used as GPIOs and are marked as TP (test points) on the DA16600MOD package. The GPIOs which are not available are:

- DA16200: GPIOA0, GPIOA1, GPIOA4, GPIOA5
- DA14531: P0\_0, P0\_1, P0\_3, P0\_4, P0\_6

Due to these internal connections, the SDIO, SDeMMC, and UART1 interfaces of the DA16200 are not available.

To support Bluetooth Coexistence, P06 of the DA14531 (which is internally connected to the RF switch) must be connected to a DA16200 GPIO pin as follows:

- For 1 pin Bluetooth Coexistence, connect P0\_6 to GPIOA10
- For 3 pin Bluetooth Coexistence, connect P0\_6 to GPIOA9

If GPIOA9 or GPIOA10 is used for Bluetooth Coexistence, then it cannot be used as a GPIO.

**Table 13: DC Characteristics**

Parameter	Description	Conditions	Min	Typ	Max	Units
I <sub>BAT_ACTIVE</sub>	Battery supply current	-	-	0.4	-	mA
I <sub>BAT_BLE_ADV_100ms</sub>	Average battery supply current with system in Advertising state (3 channels) every 100ms and extended sleep with all RAM retained.	-	-	80	-	µA
I <sub>BAT_BLE_CONN_30ms</sub>	Average battery supply current with system in a connection state with 30ms connection interval and extended sleep with all RAM retained.	-	-	92	-	µA
I <sub>BAT_HIBERN</sub>	Battery supply current with system shut down	-	-	0.6	-	µA
I <sub>BAT_RF_RX</sub>	Battery supply current	Continuous Rx	-	2.3	-	mA
I <sub>BAT_RF_TX_+2</sub>	Battery supply current	Continuous Tx; Output power at 2 dBm <a href="#">(Note 1)</a>	-	4.3	-	mA
I <sub>BAT_RF_TX_-1</sub>	Battery supply current	Continuous Tx; Output power at -1 dBm <a href="#">(Note 2)</a>	-	3.6	-	mA
I <sub>BAT_RF_TX_-4</sub>	Battery supply current	Continuous Tx; Output power at -4 dBm	-	2.8	-	mA

**Note 1** All Bluetooth applications run on DA16200, so DA16200 should be active to handle Bluetooth data (for example, Bluetooth Connection Request coming from a Bluetooth peer), in which case, Rx active current of DA16200 is added to the total current consumption.

**Note 2** The actual Tx output power is slightly different than the one indicated in the parameter name.

### 6 Power-on Sequence

The sequence after the initial switching from power-off to power-on of DA16200 is shown in [Figure 5](#).

The RTC\_PWR\_KEY is a pin that enables the RTC block of DA16200. Once RTC\_PWR\_KEY is enabled after VBAT power is supplied, all the internal regulators are switched on automatically in the sequence pre-defined by the RTC block.

Once RTC\_PWR\_KEY is switched on, LDOs for both XTAL and digital I/O are switched on shortly and then the DC-DC regulator is switched on according to the pre-defined interval. The enabling intervals can also be modified in the register settings after initial power-up.

**Figure 5: Power On Sequence**

**Table 15: Power On Sequence Timing Requirements**

Name	Description	Min	Typ	Max	Unit
T0	VBAT power-on time from 10% to 90% of VBAT	-	-	-	ms
T1	IO voltage and VCC supply	-	0	-	ms
T2	RTC_PWR_KEY turn-on time from 50% VBAT to 50% POWER_KEY * ( <a href="#">Note 1</a> )	-	5*T0	-	ms
T3	Internal RC oscillator wake-up time	-	217	-	μs

**Note 1** If the  $T_0 = 10$  ms to switch on VBAT, the recommended  $T_2$  is 50 ms for the safe booting operation. It can be externally controlled by MCU or it can be implemented using RC filter at the input of RTC\_PWR\_KEY. The recommended C is 470 nF or 1 uF (not to exceed 1 uF) and R value is chosen to have  $T_2$  delay. For example, R and C values will be 82 kΩ and 1uF when  $T_0 = 10$  ms.

P0_5	GPIOA_8	Wi-Fi_ACT
P0_6	GPIOA_9	BT_ACT
P0_7	GPIOA_10	BT_PRIO

Table 17: Component Value

Part Reference	Value	Description
R1	470 kΩ	Remove R1 when MCU control 'RTC_PWR_KEY'. This value should be chosen by customer application to achieve the enough delay time depending on the power-on time of VBAT.
C1	1 μF	Remove C1 when MCU control 'RTC_PWR_KEY'. This value should be chosen by customer application to achieve the enough delay time depending on the power-on time of VBAT. Not to exceed 1 μF.
